

part one

updated ECSpiderMan.cpp:

```
#include "ECSpiderMan.h"
#include <iostream>
using namespace std;

// Spiderman
ECSpiderMan :: ECSpiderMan(double life) : ECLife(life), ECSpider(life), ECHuman(life)
{
}

void ECSpiderMan :: Work()
{
    // do run and weave
    Weave();
    Run();
}
```

```
karin@Karin's_Laptop CLANG64 /c/Users/karin/Music/CSE-3150/lab7
$ clang++ ECSimTest.cpp ECHuman.cpp ECSpider.cpp ECSpiderMan.cpp

karin@Karin's_Laptop CLANG64 /c/Users/karin/Music/CSE-3150/lab7
$ ./a.exe
Weave
Run
** List of life
1
100
```

part two:

```
#include <iostream>
#include <typeinfo>
using namespace std;

// base class
class ECLife
{
public:
    virtual ~ECLife() {}
    void Die() {}
};

// derived class
class ECCat : public ECLife
{
public:
    void Mew() { }
};

// derived class 2
class ECDog : public ECLife
{
public:
    void Bark() { }
};

// test code
int main()
{
    ECLife *p11 = new ECCat;
    ECLife *p12 = new ECDog;
    ECLife *p13 = new ECCat;

    // How to tell what kind of life it is?
    // How to tell if say p11 and p12 point to the same kind of life?
    cout << typeid(*p11).name() << endl;
    cout << typeid(*p12).name() << endl;
    // tells what class it is

    delete p11;
    delete p12;
    delete p13;
}
```

```
karin@Karin's_Laptop CLANG64 /c/Users/karin/Music/CSE-3150/lab7
$ clang++ ECRTTI.cpp

karin@Karin's_Laptop CLANG64 /c/Users/karin/Music/CSE-3150/lab7
$ ./a.exe
5ECCat
5ECDog
```
